

Terram Root Guard

Product Information

Terram Root Guard is a black heavy duty nonwoven specifically designed with high tear strength and puncture resistance to protect against the growth of roots.

Tree roots growing under roads, drives, patios and lawns can be a nuisance and cause significant damage. 80 – 90% of roots grow outwards in the upper metre of soil and can cause lifting of the ground resulting in cracks and damage on the surface. They can also contribute to damage by undermining foundations and service pipes.

Terram Root Guard provides effective protection of pipes surfaces and structures against root damage. It is a strong, permeable barrier allowing for the free movement of ground water whilst restricting penetration from tree roots.

Step One

Prepare the ground by digging the appropriate sized hole for the size of flower / tree you wish to plant. If required, a disc may be cut and placed in the bottom.

one

Step Two

Cut the Root Guard to size and place around the sides of the hole ensuring there is no gap and overlap or tape together.

two

Step Three

Fill with soil both inside and out side of the Root Guard barrier and press down to compact.

three

Step Four

Finish to match the rest of the surroundings.
